

a) Write a list of Business Rules that describe the above scenario.

Each office has its own location and own phone number

Many agent and staff are assigned to one location

Each employee has a unique company ID where they track basic information such as name, and hire date (date they were hired effects the compensation and bonuses)

Each office has one employee who manages it

Each property has one office assigned to it and one employee assigned to it

Each property location is stored, number of bedrooms, number of bathrooms, amenities, etc.

Each property is linked to everyone who is involved in the sale

Each property has at least one owner or more

Each employee is assigned to a client who is looking to buy or rent

Some agents have one list of contractors that they keep separately and can have any many of contractors on it

Each property has inspections where the company wishes to keep track of the date, the name of inspector, and comments

b) List all the entity types that need to be modeled

Employees (Company_ID, First_Name, Last_Name, Hire_Date)

Sales Office (Sales_Office_ID, Office_Location, Office_Phone_Number)

Property (Property_ID, Property_Address, Number_Bedrooms, Number_Bathrooms, Amenity_ID),

Amenities (Amenity_ID, Amenity_Type)

Owners (Owner_ID)

Clients (First_Name, Last_Name)

Inspections (Inspection_Date, Inspector_Comment)

Contractors (Contractor_Name, Contractor_Number, Contractor_Company, Contractor_Address)

- c) Use Oracle Data Modeler to create these entity types **and their relationships**. You need to decide names for your entity types and the type of relationship (1-1, 1-M, or M-M)

d) Add attributes that you believe are meaningful. Each entity type should have about 4 attributes.
